

Innovation — Movie App

Student Number: G00472925

Module: Mobile Applications Development

Below are described Extras:

1. **"No image" also for missing movie posters.** The brief asks for this on person photos. I added it to movies too, so cards don't break when there's no poster.
2. **Enter key triggers search.** Don't have to click the SEARCH button. Just press Enter in the search box.
3. **REMOVE button on Favourites.** Quick way to remove a movie without opening Movie Details first.
4. **Back-arrow buttons.** Added to Movie Details, Person Details, and Favourites toolbars. Favourites uses `Location.back()` so it returns to wherever you came from.
5. **Selected movie and person persist across refresh.** Both `selectedMovie` and `selectedPersonId` are stored in Ionic Storage rather than passed as in-memory route state. So if you refresh the Movie Details page or the Person Details page, the same movie/person stays loaded instead of redirecting back to Home.
6. **Labelled and formatted person details.** All fields on the Person Details page have explicit labels (Also Known As, Date of Birth, Date of Death, Place of Birth, Biography) so the viewer never has to guess what each value represents. Dates are formatted as 02-Sep-1989 rather than the API's raw 1989-09-02. Each labelled line is hidden via `*ngIf` when the API returns no value, so empty fields are never shown.
